# When it comes to **EMS really under**

**For over 20 years EMS has built up an unrivalled reputation for understanding the needs of the market, both on-shore and off-shore, Hazardous Area Equipment is about much more than just supplying products.**

It is also essential that environmental and legal requirements are constantly monitored and liaised with both the manufacturers and most importantly "YOU" the customer.

The new standard EN 61241... supersedes the previous valid dust standard EN 50 281 from July 1, 2007.

This new standard EN 61241... must be observed because a high risk potential in dust explosion areas is involved in which peoples' lives are in danger.

The standard takes into account that the demands on the electrical equipment in areas with a risk of dust explosion are increased in comparison with the industrial standard and the previous standard EN 50281.

This obliges the owner to use products which correspond to and conform with the EN 61241 standard exclusively for new installations.

Also owners are now responsible for the protection of the workforce and safety of the plant according to the new European ATEX directive 1999/92/EC (ATEX 137).

There can be no compromise in the quality of both the products and service provided. With the back-up of specialist teams, EMS are able to offer you the highest quality of customer service.

As part of the Rexel group, the largest distributor of electrical products in the world, we have unrivalled access to leading manufacturers, not only in the United Kingdom, but also throughout the world. We are able to offer you the most comprehensive range of product available.

All products shown are an indication only of the vast range of various manufacturers equipment available within the UK and EU countries, and other types and variations are available upon request both via EMS locations and the national network of the Senate Electrical branches.

# Definitions

## EXPLOSION PROTECTION:

The important principles for integrated safety explosion protection are as follows:

- 1 Measures are taken to avoid hazardous atmospheres whenever possible
- 2 Measures are taken which prevent ignition of hazardous atmospheres
- 3 Measures are taken which limit the explosive effect to a safe degree

## THIS DIFFERS FROM:

Primary explosive protection:

These are precautions taken to prevent or restrict the formation of hazardous explosive atmospheres

Secondary explosive protection:

This covers the second group of measures, which are intended to prevent the ignition of an atmosphere that is capable of exploding

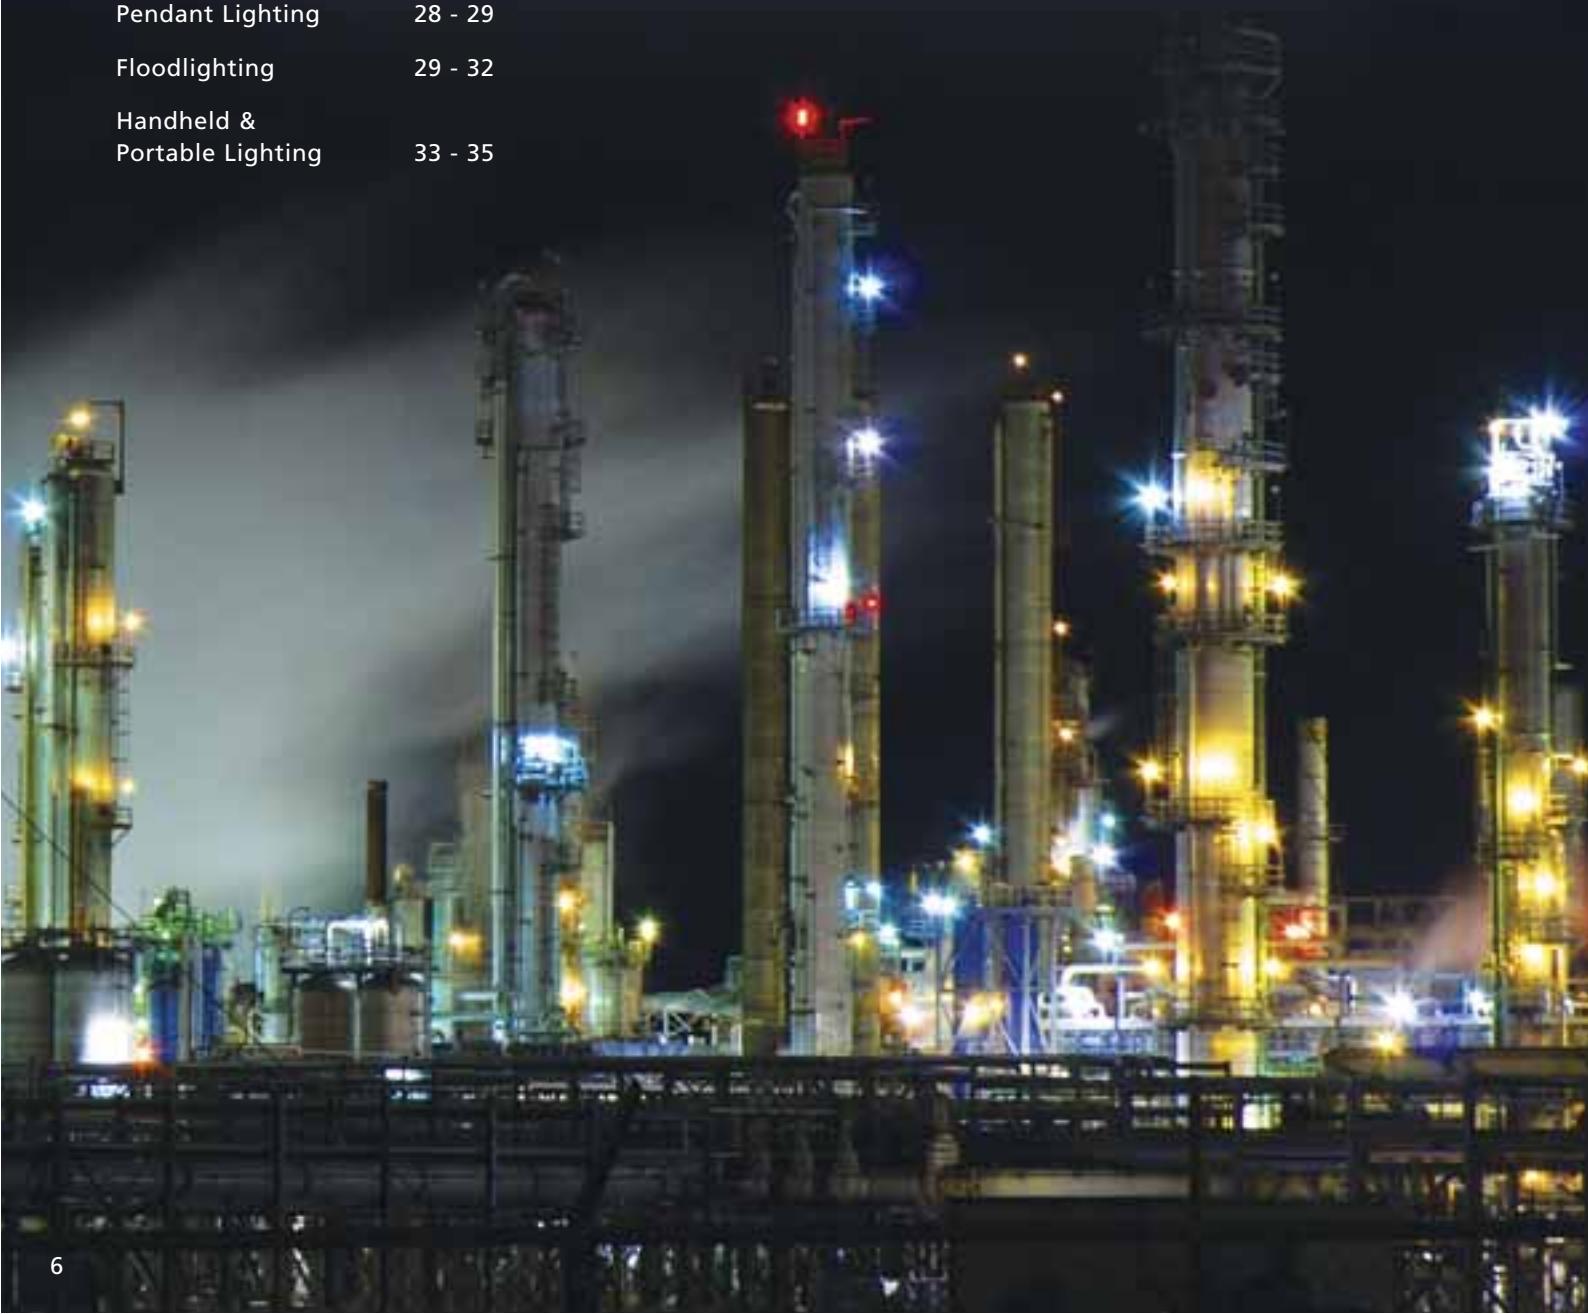

Definition	Zone	A device from the following must be used	Atmosphere
Area in which a potentially explosive atmosphere as a mixture of air and flammable gases, vapours or mists is present either frequently or over a prolonged period	0	1	G
Area in which under normal operation a potentially explosive atmosphere as a mixture of air and flammable gases, vapours or mists can occasionally form	1	2 1G also possible	G
Area in which under normal operation a potentially explosive atmosphere as a mixture of air and flammable gases, vapours or mists is not normally present but may occur for just a short period	2	2 1G, 2G also possible	G
Area in which a potentially explosive atmosphere in the form of a cloud of flammable air-borne dust is present either constantly, over prolonged periods or frequently	20	1	D
Area in which under normal operation a potentially explosive atmosphere in the form of a cloud of flammable air-borne dust can occasionally form	21	2 1D also possible	D

### HTS TRANSIT SYSTEM

What is a Cable Transit System?

A Transit System is a means to maintain the integrity of a firewall, bulkhead or deck through which cables, pipes and other services pass. The transit system will seal against and offer resistance to:

- Fire
- EMC
- Water
- Radiation
- Gas
- Chemicals
- Explosion
- Ultra Violet Light
- Smoke
- Vermin

Where would you use a transit system?

Wherever a wall or bulkhead is penetrated by cable or pipe, the occupants and integrity of the structure are exposed to risk from hazards such as fire and smoke, water ingress, toxic gases and attack by vermin.

### Typical Applications

- Offshore Platforms
- Oil and Gas Refineries
- Floating Production Off-loading Vessels
- Nuclear Plants
- Ship Building
- Computer/Bank Installation
- Telecommunications
- Jet Engine Test Facilities
- National Defence Agencies
- Tunnel systems
- Water Treatment Plant
- Portable Buildings
- Chemical Plant
- Pharmaceutical Manufacturing
- Offshore Accommodation Modules

### Why Use a Hawke Transit System?

- Increased Safety
- Total Inspectability
- Flexibility
- Speed of Assembly
- Cost effectiveness
- Quality and Certification

**MARINE FRAMES****The HMX Frame**

For general use. A Hawke compression tool (Ref. 981) is required for use with all 'X' designated frames.

**The HMFX Frame**

Has a 60mm wide flange and is available in the same materials and finishes as HMX frames. For overall dimensions of HMFX frames add 120mm (allowance for flange) to those given for standard HMX frames.

**The HMOX Frame**

A removable end allows the frame to be installed around existing cables and pipes.

**CIVIL FRAMES**

The HCX and HCOX range to suit installation in concrete/brick.

Various sizes and permutations available.

Please ask for further details

**ROUND TRANSIT FRAMES**

- Certified for both civil and marine applications.
- May be used to seal existing cable and pipes.
