View-Ultra	Sekurit Glass	2000mm	bracket will fit 76mm pole	5 year
Durabel	Stainless Steel	900mm	bracket will fit 76mm pole	5 year

How to select the correct size convex mirror

Choosing the correctly sized [convex mirror](#) is important in order to achieve the clear view required for safety. If the mirror is too small, drivers / operators will not be able to see the hazard and this may in fact increase the hazard. The potential drawback to choosing a mirror too big, is that it may be difficult to mount within space constraints. Firstly measure up the distance between the motorists position when they stop at the junction and the site for the mirror. Consider that it may be preferable to mount the convex roadside mirror at a height to reduce the risk of vandalism or collision with vehicles. Use the table below to select the corresponding size mirror. The mirror position and size should be tested well before use.

Mirror Size (mm)	Maximum Observation Distance (Metres)
300Ø	2
400Ø	3
500Ø	5
600Ø	6 – 7
700Ø	7 - 9
800Ø	9 – 11
400 x 600	5
600 x 800	10
800 x 1000	15
1000 x 1200	20
