

PRODUCT INFORMATION

PRODUCT DEVELOPMENT AND IN-HOUSE TOOLING

Cellular Developments work with a vary wide range of materials in both solid and cellular form. We undertake material development should our standard materials be unsuitable to meet the criteria of a particular project.

We are aware that careful selection of the elastomer is essential to ensure that all design criteria are met.

We are able to offer complete solutions to engineering problems and welcome the opportunity to discuss projects with our staff and work collaboratively. We can develop new processes and materials to optimize your products and achieve significant performance or cost gains. Our in-house tooling facility is capable of producing fast prototype tooling and production tools.

Our dedicated team of engineers and rubber technologists have over twenty years experience in processing both thermoset and thermoplastic rubber.

We fully understand the customers need to achieve a quality product for a cost effective price, delivered on time.
