

Cast PU edging

Grant Westfield offer a fabrication service incorporating Cast PU Edging to achieve panels with encapsulated edges in a limitless range of profiles, sizes and configurations.

The casting technique allows impact resistant water sealed edges to be formed on panels providing varying profile designs and inset cast blocks even in a single component.

Because moulds and tooling are required this technique is not suitable for single component manufacture. However the methods we use to prepare the tools enables very small batch productions to be competitively produced, meeting the needs of the smaller project. Where complex edging and corner work is required this process provides the ideal solution.

Core and surface material are infinite from chipboard to plywood and laminate to lino.

Casting can create special details like recesses for inserts and grommet edgings as well as varying profiles on each edge of a single top.

PU colours and hardness can be varied to suit your particular application.
