

Leading the fight against imported turned parts

In order to sustain its growth, South Coast based Precision Products has selected three Citizen CNC sliding head turn-mill centres (an M-Series, K-Series and A-Series) and one Miyano BNA fixed-head turn-mill centre to add to its portfolio of 48 machine tools. The new acquisitions form part of a £400,000 investment programme to maximise a competitive advantage and win orders for previously produced overseas work that is flowing back to the UK.

Managing Director Brian Owen is adamant that the focus on continuous investment in the right equipment and the ability to retain skilled machinists is enabling his business to benefit from what he defines as 'maximising the advantage from import substitution through UK production': "From our experience and comments from other companies we know, work is now flowing at an ever greater rate back to the UK and with our investment in the latest machinery we are there to benefit."

The investment is also key to maintaining the momentum of a growing order book of sub-assembly and complete component machining supply to customers in the automotive, medical, aerospace, brewing, white goods, fluid power, defence, and telecoms sectors.

keeping manufacturing in the UK

Precision Products has two machine shops on the South Coast – headquarters in Rustington near to Littlehampton, and Hollingbury in Brighton. It employs 40 people generating sales of over £3 million and has capacity to produce well over three million parts a week.
