

High Level Aluminium Pipe Boxing from Jtech Services

Jtech Services have recently supplied and installed their Aluminium Pipe Boxing system for a rather intricate application at a New Build School project in Macclesfield.

A pre-manufacture site meeting was undertaken to understand the exact requirements for this project and number of options were discussed. Having agreed what was required a detailed measure was then undertaken and the special design of profile was manufactured.

This all contributed to the installation being completed within the time frame required. Waste was also kept to a minimum as only specific lengths were supplied and very little onsite cutting was required.

Being so closely involved with the design and manufacture of their Pipe Boxing allows Jtech Services the freedom, should the need arise, to create specific profiles for their client's requirements.

The close matching of the powder coating allowed the Pipe Boxing to blend in with the surrounding colour scheme to such an extent that it is not always easy to spot where it is!

A full range of accessories are available for all of the Jtech Services profiles including Internal & External Corners, Tee Pieces and Stop Ends.

Aluminium was the clear choice for this particular application, however other materials are readily used depending on the site application.

The need for either a steel or aluminium based pipe boxing system, finished with an FR grade powder coating is becoming more and more apparent as building facility managers and heating & sprinkler system engineers see the need to protect their services from day to day wear.
